

# Cannabis Consumption Data

The data in Figures 1, 2 and 3 below was collected through the CDC’s Behavioral Risk Factor Surveillance System (BRFSS) and provided by the University of Nevada, Reno. Figure 1, which examines alcohol consumption over a 30 day period, is broken down by demographic groups that include location, employment status, income, race, marital status, age, and sex. Figure 2 examines cannabis use in the same demographic groups. Finally, in Figure 3, we see a comparison between the separate data collected for alcohol and cannabis use over a 30-day period, finding that, across all demographic groups measured, alcohol consumption surpassed cannabis use.
