Zhonghai Ding

- Professor of Mathematics
Department of Mathematical Sciences
- Ph.D. in Mathematics
Texas A&M University, College Station, Texas
- CDC 1004, Zhonghai.Ding@unlv.edu
- <https://faculty.unlv.edu/zding/>

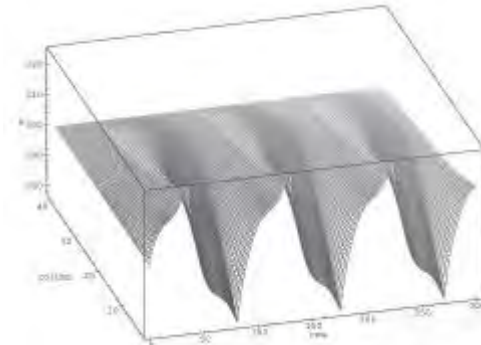

Areas of Expertise

- Control Theory
- Partial Differential Equation
- Mathematical Modeling
- Numerical Computation

Research Summary:

Dr. Ding's research interests are in mathematical modeling and analysis, control, and computation of problems arising from real applications such as nematic liquid crystals, suspension bridge systems, shape memory alloys, oxidation of metal matrix composites, control of dynamical systems, etc.. These systems are governed by linear or nonlinear partial differential equations. Dr. Ding's research focus on analyzing system behaviors, developing numerical methods for solutions, and investigating related control issues.

Expertise

- Deep Learning
- Bioinformatics
- Modification Detection
- Long-read Data Analysis
- RNA-Seq Data Analysis
- Protein Functional Analysis

Research interests

Dr. Liu currently works on the development of deep learning/machine learning-based tools to conduct long-read data analysis.

This includes, but not limited to, the estimation of short tandem repeats, DNA modification detection, RNA modification detection, and RNA-seq data analysis. Besides, Dr. Liu is also interested in functional analysis of proteins.

The ultimate goal of Dr. Liu's research is to accelerate and facilitate genetic discoveries for human disease studies.

Quantum Information and Quantum Control of Chemical Reactions

Balakrishnan Naduvalath

Department of Chemistry & Biochemistry,
UNLV

Areas of Expertise

- Ultracold Molecules
- Ultracold Quantum Engineered Chemistry
- Quantum control of chemical reactions
- Geometric phase effect in chemistry
- Stereodynamic control of chemical reactions

\$\$\$: NSF, DOD, NASA

Chemical reaction pathway in ultracold K+KRb collisions. Quantum engineered KRb molecules have been prepared at 300 nK. Ultracold polar molecules such as KRb are potential candidates for quantum computing and quantum information processing.

Controlling reaction outcome through quantum interference

Right panel: The nature of the interference can be controlled by including “geometric phase”. In the image on the right, inclusion of the geometric phase enhances the reactivity. The geometric phase (that correctly describes the sign of the wave function near a conical intersection with an excited electronic state) acts as a “quantum switch” (Hazra, Balakrishnan, and Kendrick, *J. Phys. A* **119**, 12291 (2015))

Left panel: Two paths for a chemical reaction. These two paths can interfere constructively or destructively, maximizing or minimizing the reaction rate. This quantum effect becomes magnified in the ultracold regime (Kendrick, Hazra, and Balakrishnan, *Nature Comm.* **6**, 7918 (2015)).

Simulation of fluid flow: Calculations of drag and lift

The figure (left side) presents the creation of the vortex street behind an immersed body in a fluid. It can be used to compute drag and lift in aerodynamics, such as drag and lift of aircrafts.

Simulation of fluid flow:
Creation of eddies/vortices
behind the step

The figure (right side)
depicts the creation of the
rotational structures
behind the step as a result
of the interaction of the
fluid with boundaries.

Condensed Matter Theory

- **Dr. Tao Pang**
- Professor of Physics
- Department of Physics and Astronomy
- Email: tao.pang@unlv.edu
- Website: physics.unlv.edu/~pang/

Expertise

- Theoretical and computational studies of novel materials, such as cold atoms and molecules, superconductors and superfluids, and other highly correlated systems.
- Path-integral and diffusion quantum Monte Carlo simulations and other first-principles calculations.
- Functional variation, correlated-basis, mean-field, and other analytical approaches.

Research Methods and Systems Studied

- **Analytical Approach**

Quantum Hall effect; quantum transport phenomena, superconductor-insulator transitions; vibrational modes in glasses; and slow light in cold atoms.

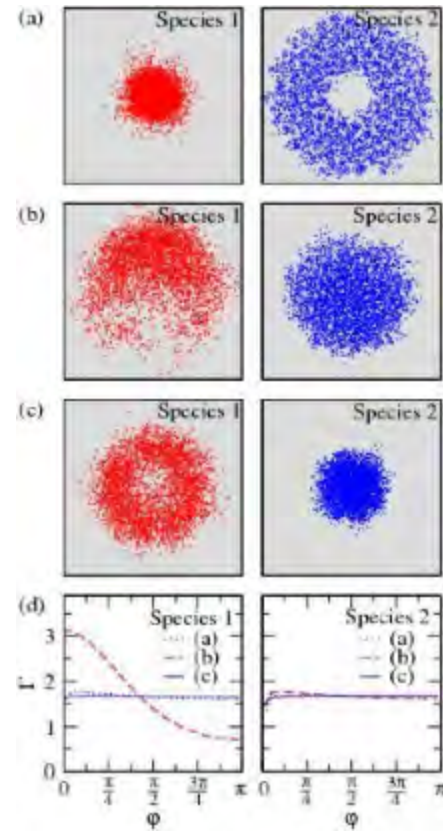

- **Diffusion Quantum Monte Carlo Simulation**

Negative donor centers in semiconductors; hydrogen molecules in confinement; ionic hydrogen clusters; and helium clusters with modified interactions.

- **Path Integral Quantum Monte Carlo Simulation**

Bosons trapped in potential wells in one dimension or two dimensions; Bose-Einstein condensation of cold atoms; and asymmetric distributions of Bose-Einstein condensates of boson mixtures.

An Example: Asymmetry of the Mixed Bose Condensates:

Asymmetric distributions of two Bose-Einstein condensates in the same trap with different cluster parameters.

- Email: zach.perzan@unlv.edu
- Website: <https://zperzan.github.io/>

Expertise

- Environmental geochemistry
- Surface water-groundwater hydrology
- Machine learning
- Uncertainty quantification
- Managed aquifer recharge

Understanding how hydrologic extremes (droughts and floods) impact water quality

Managed aquifer recharge

Geophysical surveys (top left) give us a 3D image of the distribution of sand, silt and clay within the subsurface (top right). We can then use hydrologic and geochemical models to understand how water (bottom left) and contaminants (bottom right) move through these sediments during a flood.

Floodplain biogeochemistry

Sensor arrays deployed in Colorado (top left) and Wyoming (top right) allow us to monitor sudden changes in water quality during floods. By pairing these with field experiments – such as tracer tests (bottom left) – we can develop data-driven water quality forecasts (bottom right).

Fluid dynamics of flow between cells

Computer models and mathematical approaches to studying transport processes can help us understand the roles that these structures play in the flow of water from roots to the leaves of tall trees.

These images show work based on a computational fluid dynamics approach to flow through pits in conifer tracheids.

Biomechanics of valves in plant cells

Water flows along the xylem in conifer trees from cell-to-cell through small openings called pits. The pits in many species contain structures that appear to act as valves that prevent air from spreading and blocking the transport system. The above figures show results from solid mechanics modeling of the pressures that are required to deflect the valve and seal the pit.

Advanced Numerical Methods for Moving Domain/Interface Multi-Physics Problems

Dr. Pengtao Sun

Professor

Department of Mathematical Sciences

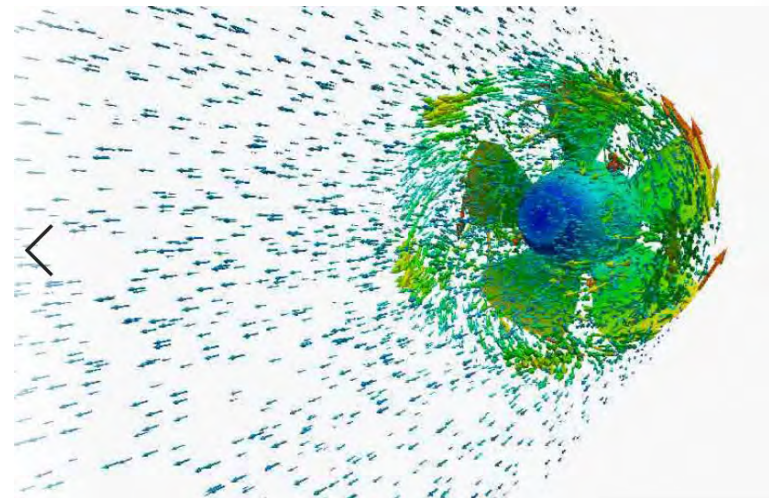

Email: pengtao.sun@unlv.edu ; URL: <https://faculty.unlv.edu/sun/>

Expertise

- Numerical Solutions of Partial Differential Equations (PDE)
- Numerical Analysis (Well-posedness, Stability, Convergence)
- Finite Element/Volume/Difference Methods
- Scientific and Engineering Computing
- Fluid-Structure Interaction (FSI) Modeling and Simulation
- Fuel Cell Dynamics, Fluid Dynamics, Electrohydrodynamics

Fluid-Hydro Turbine Interaction Problems

- Hydroelectric power generating system produces renewable energy and remains crucial for society and industry. The most significant part of this system is the hydro turbine interacting with the water flow, which involves elastic solid materials and viscous fluids and belongs to the category of fluid-structure interaction (FSI). The developments of mathematical models and numerical methodologies are critical in practice for efficient simulations of the hydro turbine, which in turn guides the design and evaluation.
- We approach the challenges in different aspects. First, based on the observation that the hydro turbine, although exhibiting large rotations, has relatively small deformation, we develop linearized elasticity equations that alleviate the burden on nonlinear solver and improves the well-posedness of spatial discretization. Second, we propose a new approach to solve the arbitrary Lagrangian-Eulerian mesh motion for rotating structure. Moreover, we analyzed the well-posedness and convergence of the finite element discretization and demonstrated the discretization is solver friendly.

Hemodynamic Fluid-Structure Interaction (FSI) Problems

- FSI simulation has become the most promising solution method to solve the hemodynamic problem existing in the clinical cardiovascular system. However, the complexity of cardiovascular environment, the artificial heart pump model, the vascular rupture, the aneurysm progression and the aortic dissection cause the deficiency of the existing FSI simulation package towards the clinical demands.
- We devoted our research to the new modeling and numerical techniques for the bloodstream-vascular-stent graft/artificial heart pump interaction problems, aiming at overcoming numerical difficulties and challenges, and developed advanced numerical methodologies to improve the efficiency and accuracy of corresponding FSI simulations. and to deliver more instructive numerical results to medical professionals for helping out patients on an efficient and accurate diagnosis and treatment.

Computational Materials Science

Understand cancer from an embryonic prospective

Dr. Mo Weng

Assistant Professor

School of Life Sciences

Phone: 702-895-5704

Email: mo.weng@unlv.edu

Expertise

- Epithelial-mesenchymal transition
- Developmental genetics
- mechanobiology
- Cancer biology

Understand cancer from an embryonic prospective

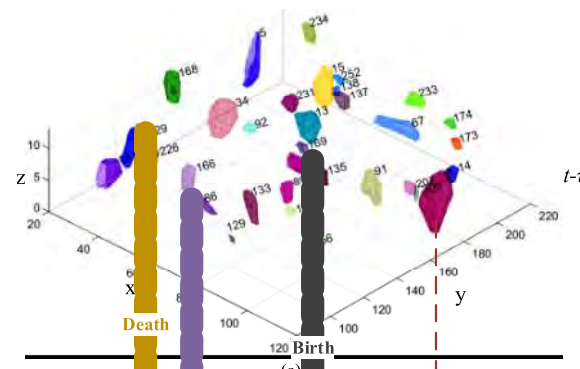

- Metastasis, the cause of death for 90% cancer patients, is not a cancer invention but a hijacked natural program essential for generating diverse structures in embryos, called epithelial-mesenchymal transition (EMT).

Understand cancer from an embryonic prospective

We use multidisciplinary approaches to study both biochemical and mechanobiological pathways controlling cell polarity and cell fate.

- Seeing is believing: Laser scanning confocal imaging probes micrometer cellular structures in 3D at high resolution and sensitivity
- Live cell imaging records the dynamics of cells and proteins as the living embryo taking on increasingly complex structures.
- Machine-learning approaches extract invisible principles from information-rich images and make predictions
- Genetic approaches such as gene editing test the roles of individual genes and their interaction.

Multi-Messenger High Energy Astrophysics

Dr. Bing Zhang

Department of Physics and Astronomy

Phone: (702)895-4050

Email: zhang@physics.unlv.edu, bing.zhang@unlv.edu

Expertise:

Theoretical astrophysics

Transients (gamma-ray bursts, fast radio bursts, etc) astrophysics

Multi-messenger (EM, gravitational waves, neutrinos, etc) astrophysics

- Dr. Zhang's research covers a broad spectrum in **high-energy** astrophysics. He studies **black holes** of different scales, **neutron stars** of different species, and intense **jets** they launch. He is most actively working on the following three directions:
 - **Gamma-ray bursts** (the most luminous explosions in the universe)
 - **Electromagnetic counterparts** of gravitational waves
 - **Fast radio bursts** (a mysterious type of radio bursting signal)

- In terms of observational data, Dr. Zhang's theoretical work make use of multi-wavelength and multi-messenger data:
 - **Multi-wavelength**: across the entire electromagnetic spectrum (from MHz radio waves to TeV gamma-rays)
 - **Multi-messenger**: Besides the traditional electromagnetic radiation, also include gravitational waves, neutrinos, and cosmic rays.

Zhou Lab – Experimental AMO physics
